## This Page Is Inserted by IFW Operations and is not a part of the Official Record

## **BEST AVAILABLE IMAGES**

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

## IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problems Mailbox.

## STIC-Biotech/ChemLib

From: Sent: To: Subject: Tuesday, February 04, 2003 11:23 AM STIC-Biotech/ChemLib Sequence search of Application NO: 09/775,181

Please do a standard search of SEQ ID NOS: 1, 2, and 4 against both the commercial and interference nucleic acid databases.

Thank you very much!

Run on:

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

AL Submitted (04-SEP-2001) Sanger Centre, Hinxton, Cambridgeshire, Submitted (04-SEP-2001) Sanger Centre, Hinxton, Cambridgeshire, Submitted (04-SEP-2001) Sanger Centre, Hinxton, Cambridgeshire, Cablo 15A, UK. E-mail enquiries: humquery@sanger.ac.uk on Sep 6, 2001 this sequence version replaced gi:15041820. During sequence assembly data is compared from overlapping clones. Where differences are found these are annotation some. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above. This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP thtp://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 10, constructed by the Sanger Centre Chromosome 10 constructed by the Sanger 
                                                                                                                                               Human DNA sequence from clone RP11-561H23 on chromosome 10, AL35587
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

Quality coverage: 4.61x in 020 bases; sum-of-contigs Quality
coverage: 4.08x in 020 bases; agarose-fp
                                                                                                                                                                                                                                                                                                                                                                 NOTE: This is a 'working draft' sequence. It currently consists of 10 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

NOTE: This is a 'working draft' sequence. It currently consists of 49 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                           NOTE: Estimated insert size may differ from sequence length

Description: 1st strand cDNA was primed with an oligo(dT) primer (ATGTGGCCTTTTTTTTTTTTTTTTTT double-stranded cDNA was synthesized using specific 5' and 3' primers and amplified by PCR. The PCR product was digested with Sfil and size selection was performed to exclude fragments <1.5kb.The Sfil-digested PCR product was cloned into distinct Drail sites of pME18S-FL3. XhoI sites just outside the Drail sites can be used to isolate the cDNA insert. Libraries were constructed by Sugano et al. (University of Tokyo, Institute of Medical Science). Custom primer used for sequencing

(5' end primer [CTTGGTCTGAAAAGCTGCG];
                                                                                                                                                                                                                                                                                                                                                                                                                          PRI 09-DEC-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Lab host:

It currently consists of 25 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

on Sep 19, 2001 this sequence version replaced gi:14586034.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality) as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em; EMBL; Sw; SWISSPROT; Tr:, TREMBL; WP; WORNEPP; Information on the WORNEPP that we have a subsequenced and the sequenced and the sequenced on the WORNEPP that we have a subsequenced and the sequenced on the WORNEPP that we have a subsequenced and the sequenced on the WORNEPP that we would be a subsequence on the worner and the sequenced on the worner and the sequence of the worner and the sequenced on t

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present cDNA sequence encodes human G-protein coupled receptor (GPCR) which is a 7 transmembrane protein of G-protein coupled receptor (GPCR) super family. NGPCR is expressed in hypothalamus, focal brain, brain, cerebellum and testis. NGPCR spans the cellular membrane and is involved in signal transduction pathways. Human NGPCR is useful for treatheng obesity, inflammation, immune disorders, diabetes, heart and coronary disease, metabolic disorders and cancer. NGPCR s are also used as reagents in assays for screening compounds that are useful in the therepseutic treatment of physiclogical and behavioural disorders. NGPCR is useful for identifying compounds that modulate NGPCR gene expression and/or gene product activity. NGPCR DNA is also useful for the diagnostic and prognostic evaluation of disorders related to NGPCR function.

CN Nucleotide constructs encoding functional NGPCR and mutant NGPCR variants are used in gene therapy. NGPCR probes are also useful for the interval of the contraction and validation of novel molecular targets for a contraction.
                                                                                                          isolated polynucleotides encoding human G protein coupled tor (NGPCR), useful as probe and for treating disease involving detecting mutant NGPCR or abnormally expressed NGPCRs for
                                                                                                                                                                                                                           English

Novel isolated polynucleotides encoding human G protein coupled receptor (NGPCR), useful as probe and for treating disease involving GPCR, detecting mutant NGPCR or abnormally expressed NGPCRs for diagnosing disease

Disclosure; Page 71-73; 73pp; English

The present invention relates to human G-protein coupled receptor (NGPCR) which is a 7 transmembrane protein of G-protein coupled receptor (GPCR) super family. NGPCR is expressed in hypothalamus, focal brain, brain, cerebellum and testis. NGPCR spans the cellular membrane and is involved in signal transduction pathways. Human NGPCR is useful for treathent obseity, inflammation, immune disorders, diabetes, heart and coronary disease, metabolic disorders and cancer. NGPCR are also used as reagents in assays for screening compounds that are useful in the therapeutic treatment of physiological and behavioural disorders. NGPCR is useful for identifying compounds that modulate NGPCR gene expression and/or gene product activity. NGPCR DNA is also useful for the diagnostic and prognostic evaluation of disorders related to NGPCR function.

C Nucleotide constructs encoding functional NGPCR and mutant NGPCR variants are used in gene therapy. NGPCR probes are also useful for the identification, selection and validation of novel molecular targets for dentification. receptor and 3' drug discovery. The present sequence is human G-protein coupled (NGPCR) cDNA containing coding sequence with the surrounding 5' regions drug

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present cDNA sequence encodes human G-protein coupled receptor (NGPCR) which is a 7 transmembrane protein of G-protein coupled receptor (GPCR) super family. NGPCR is expressed in hypothalamus, foetal brain, brain, creabellum and testis. NGPCR spans the cellular membrane and is involved in signal transduction pathways. Human NGPCR is useful for treathing obesity, inflammation, immune disorders, diabetes, heart and coronary disease, metabolic disorders and cancer. NGPCR's are also used as reagents in assays for screening compounds that are useful in the therepeutic treatment of physiological and behavioural disorders. NGPCR is useful for identifying compounds that modulate NGPCR gene expression and/or gene product activity. NGPCR DNA is also useful for the diagnostic and prognostic evaluation of disorders related to NGPCR function.

Nucleotide constructs encoding functional NGPCR and mutant NGPCR variants are used in gene therapy. NGPCR probes are also useful for the
